

MystiCrypt - User Documentation

MystiCrypt is a Text Encryption & Decryption Suite developed using .NET Framework with C++/CLI. It provides an easy-to-use interface for encrypting and decrypting text using classical ciphers such as Caesar, Atbash, and Vigenère.

Installation & Setup:

1. Ensure you have Windows OS with .NET Framework installed.
2. Download the MystiCrypt application (EXE file).
3. Double-click the EXE file to launch the application.
4. No additional installation required.

Getting Started:

1. Enter your text into the 'Input Text' box.
2. Select the cipher method from the menu (Caesar, Atbash, Vigenère).
3. Click 'Encrypt' to secure your message.
4. Click 'Decrypt' to reveal hidden messages.
5. Copy or save the output as needed.

Cipher	Description	Example
Caesar Cipher	Shifts each letter by a fixed number.	HELLO → KHOOR (Shift 3)
Atbash Cipher	Reverses the alphabet mapping.	HELLO → SVOOL
Vigenère Cipher	Uses a keyword for polyalphabetic substitution.	HELLO (Key=KEY) → RIJVS

Features:

- Encrypt and decrypt text with classical ciphers.
- Easy-to-use Windows Forms interface.
- Copy encrypted/decrypted text.
- Supports multiple cipher techniques.

FAQ & Troubleshooting:

Q: Why is my output unreadable?

A: Ensure you used the correct key (for Vigenère).

Q: The app does not start?

A: Verify that .NET Framework is installed on your system.

About MystiCrypt:

Version: 1.0

Developer: Chavindu Pahasara

MystiCrypt is a student project designed to demonstrate classical cryptographic algorithms with a graphical user interface.
